Introduction

What is GIS?

GIS is a computer based powerful set of tools for collecting, storing, retrieving, mapping, analyzing, transforming and displaying spatial and non spatial data from geographic world for a particular set of purposes that varies for each discipline.
What is Tourism?

"Tourism is a composite of activities, facilities, services and industries that deliver a travel experience, that is, transportation, accommodation, eating and drinking establishments, entertainment, recreation, historical and cultural experiences, destination attractions, shopping and other services available to travelers away from home."

Tourism is one of the industries with the strongest effect on the economy, because it helps in developing other sectors.
According to Van Arragon and Wessels (1994), there has always been a direct relationship between tourism and cartography. Maps of travel routes and general information about the areas to visit are used in selecting the destination and in planning travel and stay.

Why Use GIS in Tourism

- Both GIS and tourism share a common characteristic, that is, both cross the boundaries of disciplines and application areas.

- GIS has been applied in many fields including geography, forestry, urban development and planning, and environmental studies.

- Similarly, tourism has been a subject of interest to geographers, economists, business, environmental planners, anthropologists, and archeologists.

According to Van Arragon and Wessels (1994), there has always been a direct relationship between tourism and cartography. Maps of travel routes and general information about the areas to visit are used in selecting the destination and in planning travel and stay.
### Capabilities of GIS in Tourism

<table>

Tourism Maps

GIS applications can provide three different types of informations:

- **Tourism resource maps** – Analyse the resource set to identify how much is available and where it is. To determine the capability of an area for the creation of new tourism products or services, identifying locations suitable to tourists or tourism.

- **Tourism use maps** – To analyse the resource set to evaluate land use options and identify zones of conflict or complementarity’s, such as access points, water, wildlife habitats etc.

- **Tourism capability maps** – To analyse the resource set to monitor tourist resources at risk due to management, planning decisions and other sectors.
GIS in Tourism Planning: Requirements of Tourism from GIS

In the tourism industry, GIS is used to provide:

- A digital map base for printed maps
- Digital files for Internet mapping
- Digital files for mobile mapping
- Attractions map
- Website with interactive mapping
Tourism planning requires more spatial data collecting and processing, as all locations and their interrelations should be defined and analyzed within a spatial context.

Procedure Involved for creation of Spatial Database

1. Acquisition of graphical Maps covering the Region
2. Converting the paper maps into digital maps by digitizing
3. Creation of topology to establish relationships between the map features
4. Transformation into real world coordinates.
GIS in Tourism Planning...

Extended Layer Model

- Hotels
  - Hotel IBIS***
  - Hotel Best Western****
- Infrastructure
  - Restaurants, museums, sights, event locations, etc.
- Vegetation, railways, watercourses, etc.
- Buildings
- Roads
- Real world
Application Scenario

- A thematic mapper can be used to integrate tourist information and GIS data to build tourist maps.

- SVG can offer the possibility to turn layers on or off to create the representation which fits to the requirements of the user.

- All the layers can be combined without restrictions to achieve the goal of the user.
Application Scenario...

Integrated GIS System...
Potential Benefits of Tourism GIS

- Intelligent Mapping
- Analytical Capabilities
- Modeling and Prediction
- Revenue Generation
Methodological issues

- GIS use in recreation and tourism has been slow due to uncoordinated and ad hoc data collection procedures.

- Data derived from planning or policy making studies typically are collected at different times, by different researchers, for different purposes using different units of analyses and samples.

- Updating and maintaining data is most effective if incorporated into regular organizational procedures of the public agencies, which hold relevant boundary and attribute information.
Case Study: Tourist Destinations ZLATIBOR AND ZLATAR

This study was carried out in tourist destination Zlatibor (Čajetina) and Zlatar (Nova Varos), which have a lot of tourist resources, facilities, products and offers. Some of the hotels in destination Zlatibor and Zlatar and most important tourist places were considered and transferred to the system.

Softwares Used:
- Arc GIS 9.1
- Arc MAP
- Arc Catalog
Steps Inolved for arrangements

Steps followed for establishing arrangement and density of tourist objects:

- Determination of tourist destination (raster map)

- Creation of attribute data (table)

- Determination of important and necessary places for tourism.

- Creation of thematic maps

- Ovelapping the layers of thematic maps
1st Step : Zlatibor’s RASTER MAP
### 2nd Step: Creation of ATTRIBUTE DATA

#### Table 4: Layers and attributes

<table>
<thead>
<tr>
<th>Name of Layer</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location (Destination)</td>
<td>Name (Zlatibor, Zlatar)</td>
</tr>
<tr>
<td>Road</td>
<td>ID, Type</td>
</tr>
<tr>
<td>River</td>
<td>ID, Name</td>
</tr>
<tr>
<td>Lake</td>
<td>ID, Name</td>
</tr>
<tr>
<td>Railway</td>
<td>ID, Name</td>
</tr>
<tr>
<td>Boundary of District (Čajetina, Nova Varoš)</td>
<td>ID, Name, Area</td>
</tr>
<tr>
<td>Nature park</td>
<td>ID, Area</td>
</tr>
<tr>
<td>Settlement</td>
<td>ID, Name</td>
</tr>
<tr>
<td>Hotel</td>
<td>ID, Name, Category, Number of Rooms, Property</td>
</tr>
<tr>
<td>Resting house</td>
<td>ID, Name</td>
</tr>
<tr>
<td>Restaurant</td>
<td>ID, Name, Property</td>
</tr>
</tbody>
</table>
3rd Step: Determination of tourism places

Destination boundaries and roads
Case Study...

The hotels and restaurants (Vector map)
4th Step: Thematic Maps Creation

Tourist subdestinations

Tourist attractive areas
Case Study...

5th Step: Overlapping the thematic map layers

Determination of the location for ski-runs
Conclusion

• Successful implementation of GIS promotes importance of information over technology.

• GIS has been successfully used in tourism for collecting, analyzing, modeling and visual presentation of tourist data. GIS is also used for bring the dereferenced data(spatial and non spatial) of geographic location into digital maps.

• The integration of tourism data and GIS data is still a big challenge for the tourism industry today.
